PROBLEM STATEMENT

- Netflix has become one of the most prominent global streaming platforms, continuously expanding its library with a mix of original productions and licensed content. However, with growing competition from platforms like Amazon Prime, Disney+, and regional OTT providers, Netflix must strategically analyze its content catalog to identify strengths, gaps, and opportunities.
- The specific problem to be addressed in this project is **'Content Trends Analysis for Strategic Recommendations'**. The aim is to uncover how Netflix's content distribution (Movies vs. TV Shows, genres, and country contributions) has evolved over the years. This will enable the identification of key genres, audience preferences, and strategic insights into global content expansion.

Project Description

1. **Analyze** the distribution and growth of Movies and TV Shows on Netflix over the years.
2. **Identify** the most frequent genres and observe changes in their popularity.
3. **Compare** country-wise contributions to Netflix's content base to assess global diversity.
4. **Provide** strategic recommendations for future content acquisition and production.

Significance of the Study

This analysis is significant for understanding Netflix's **content evolution and audience engagement patterns**. By identifying popular genres and underrepresented regions, the study offers actionable insights that can help Netflix make **data-driven business decisions**. Such findings are valuable for:

- Enhancing **content strategy** and balancing global vs. local productions.
- Recognizing **market trends** and regional viewer interests.
- Supporting **strategic investments** in specific content types and countries.

WHO ARE THE END USERS?

- Netflix Management and Strategy Team
- Netflix Content and Production Teams
- Netflix Data Analytics and Insights Department
- Data Analysts and Data Scientists (in the OTT or media industry)
- Academic Researchers and Students (studying data analytics or media trends)
- Business Analysts and Market Researchers

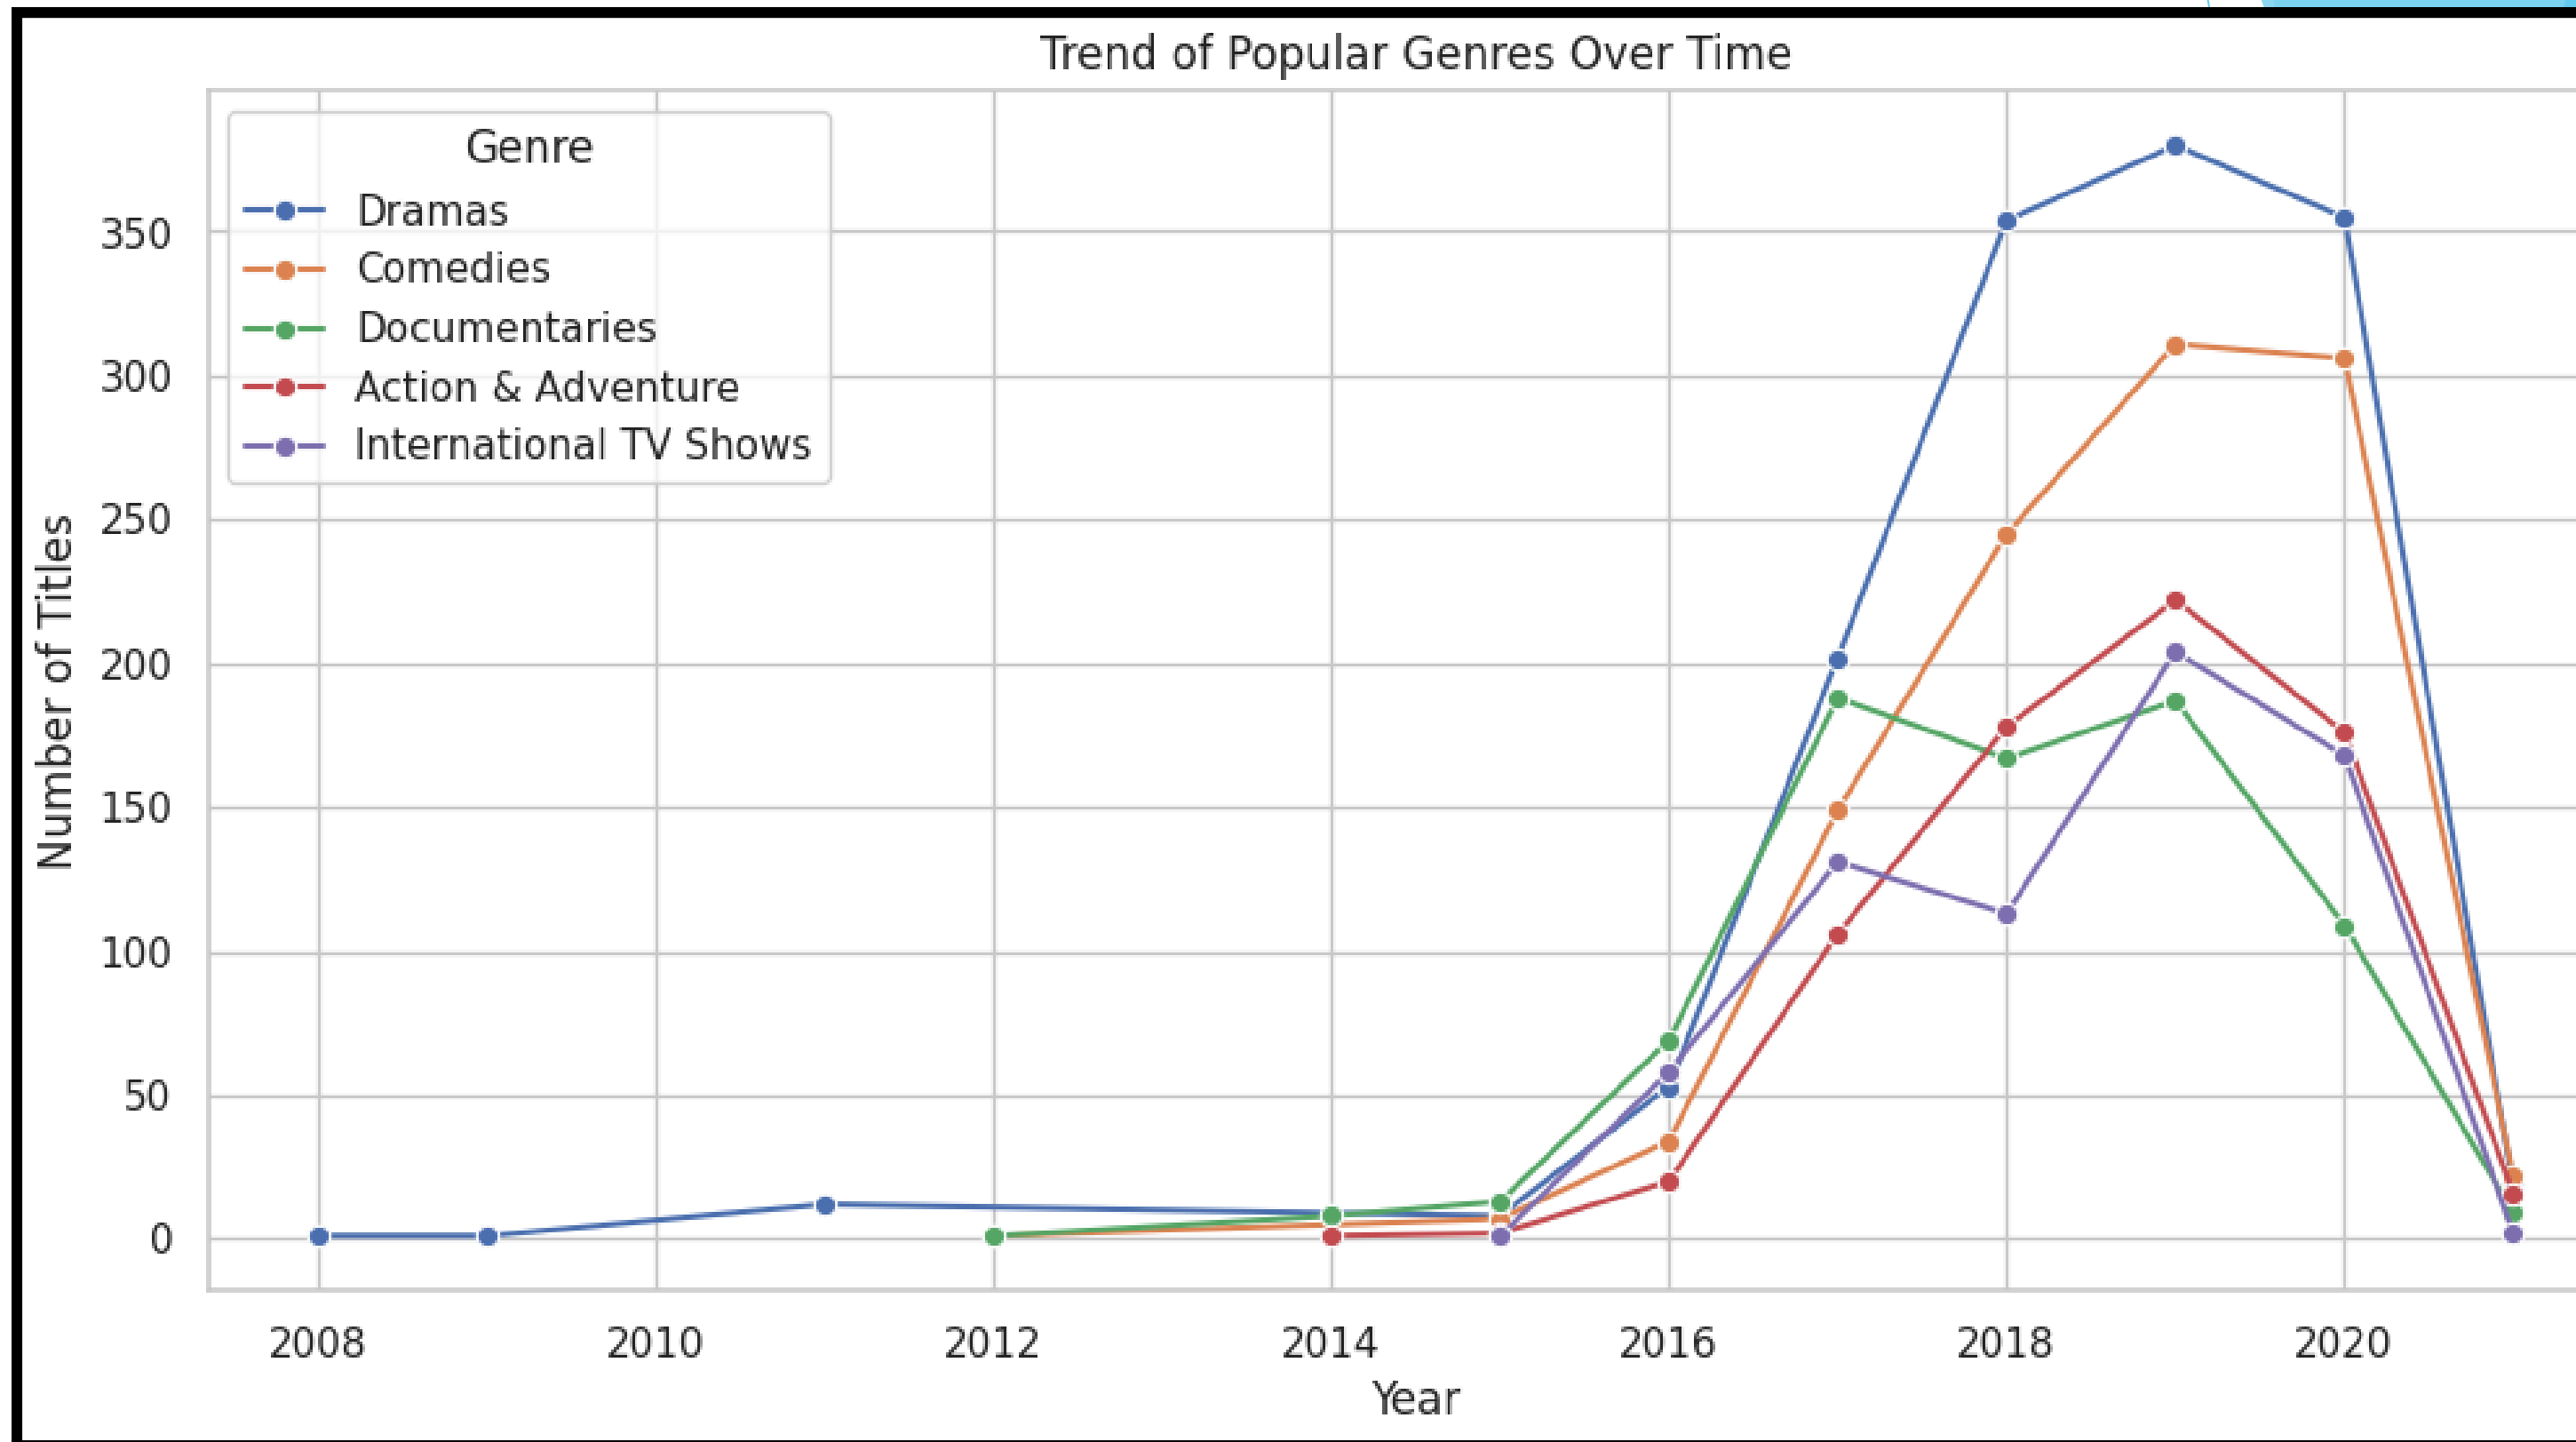

Technology Used

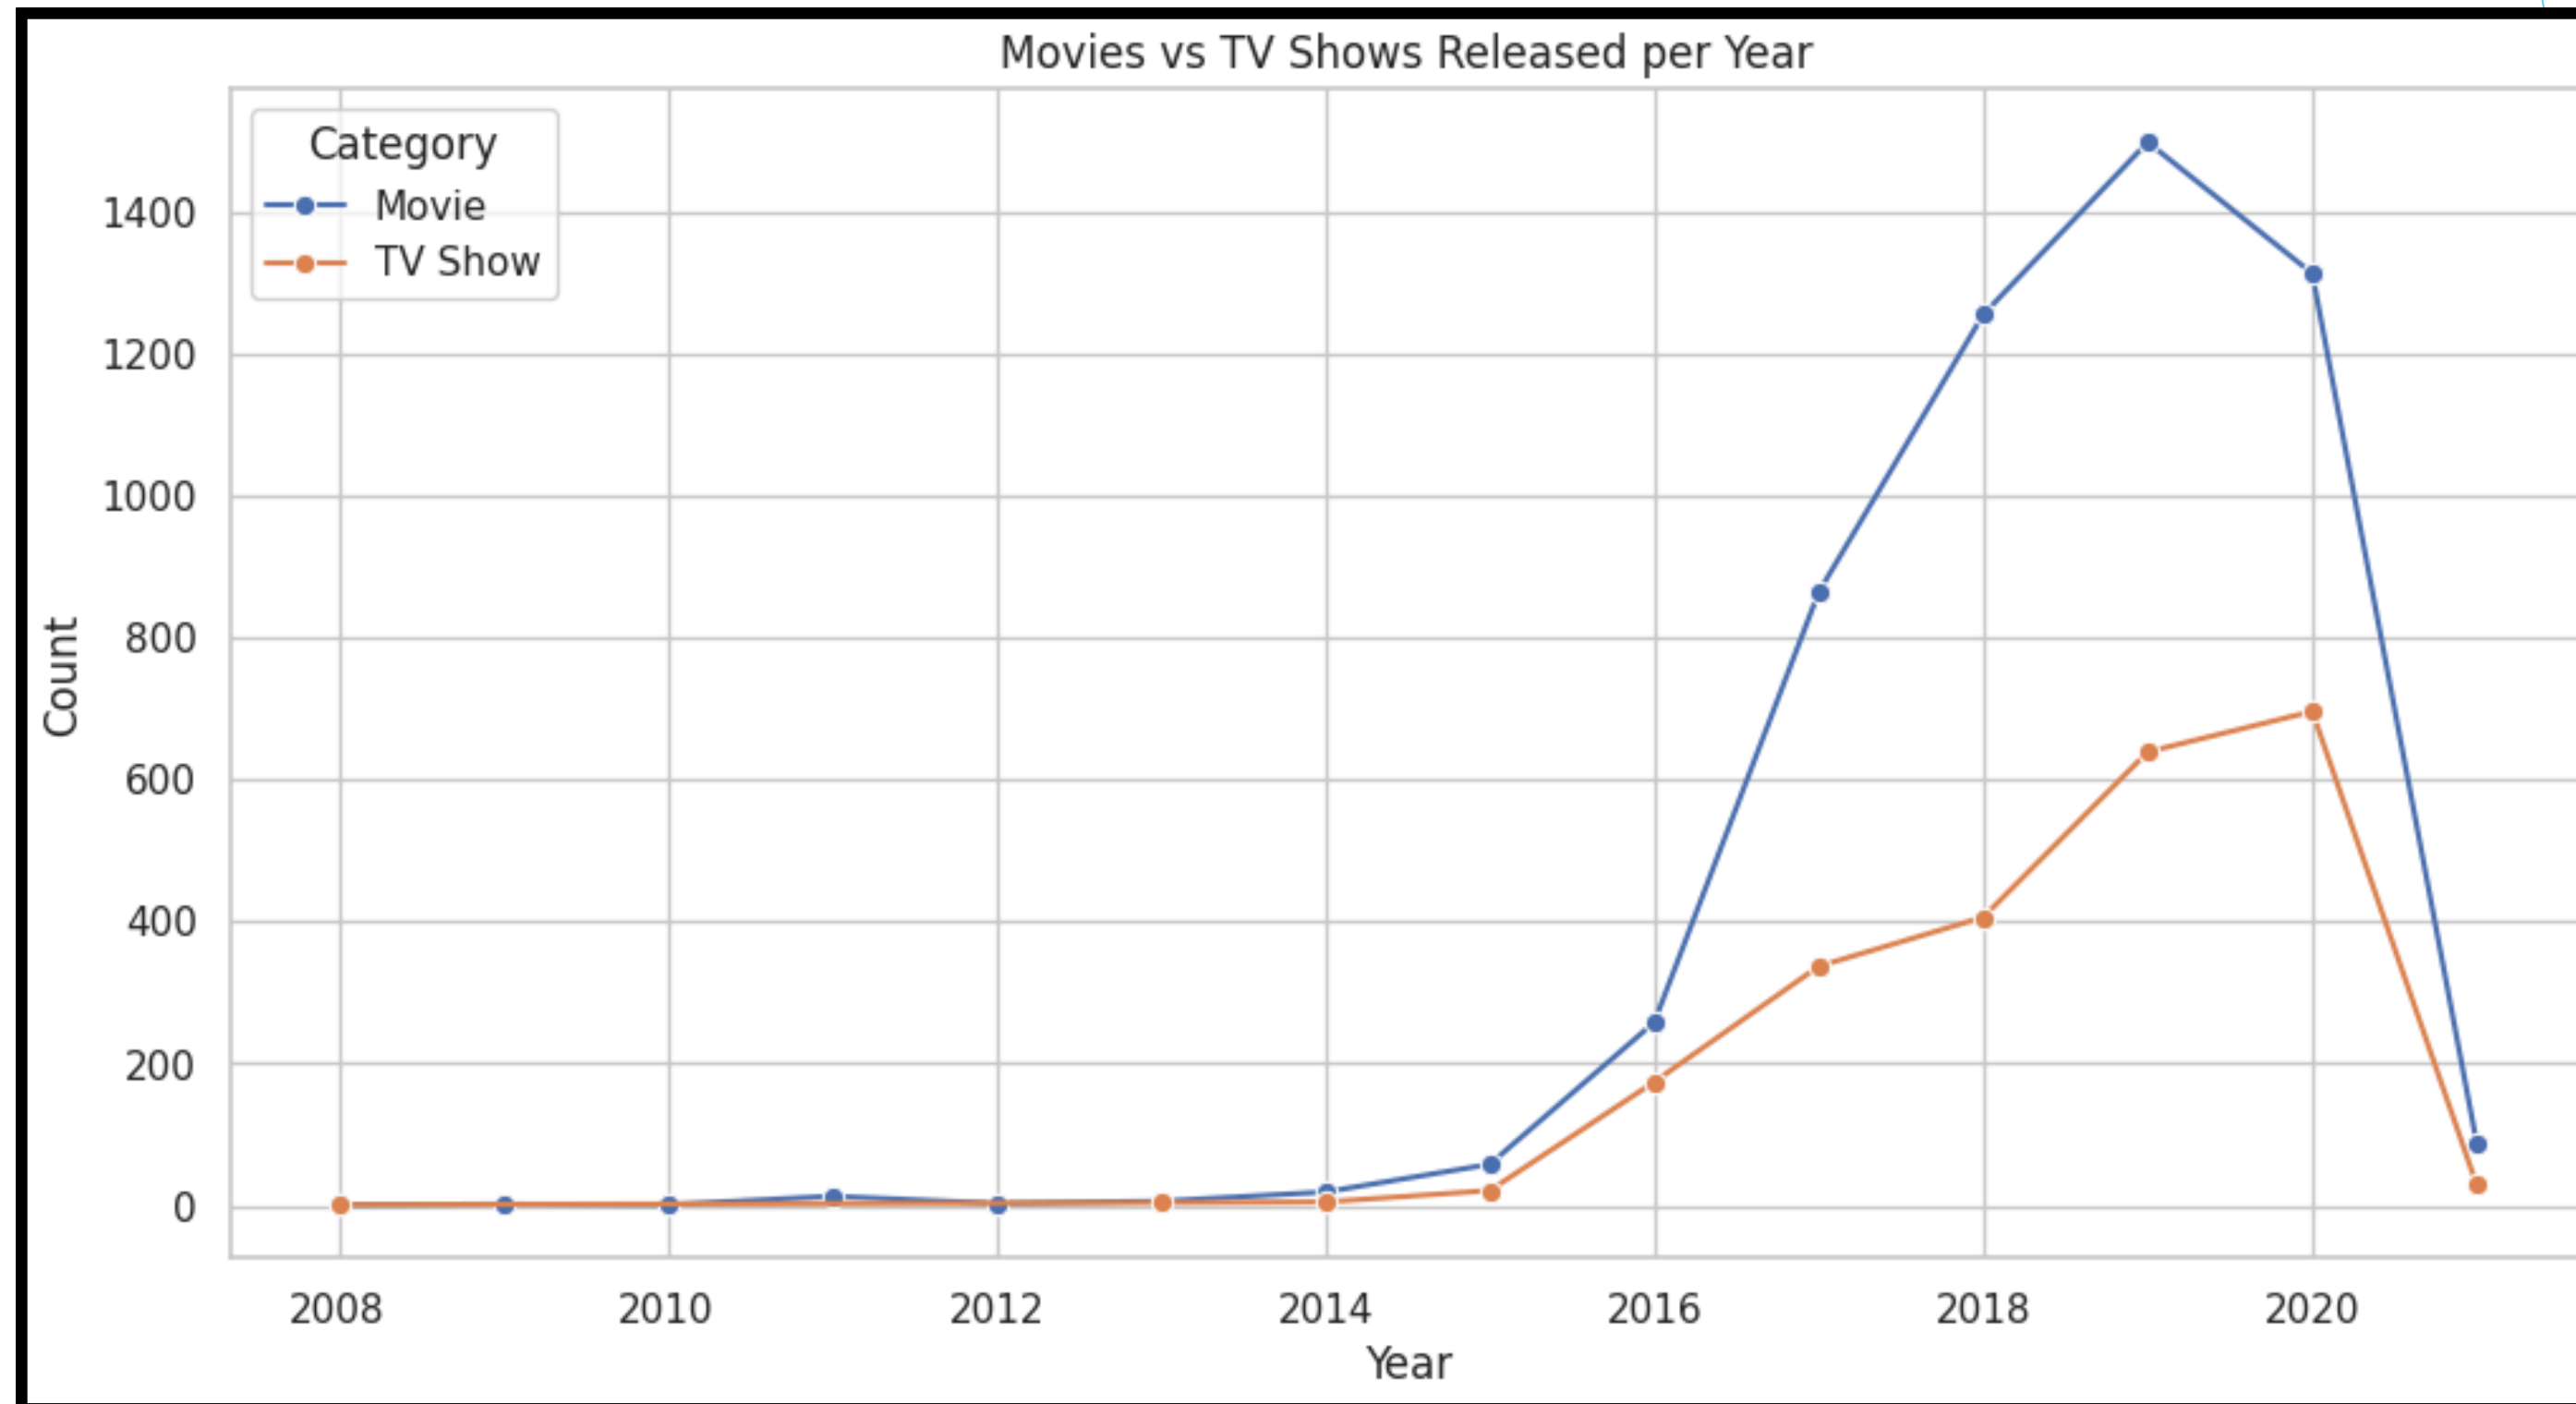

- Python
- Jupyter Notebook
- Google colab
- Matplotlib
- numpy
